TITLE:

Filter for cinema film developing soln. etc. - consists of

column packed with floating hollow aluminosilicate microspheres and regenerated by backflow of clean liq.

ABSTRACTED-PUB-NO: SU 1650196A

BASIC-ABSTRACT:

The filter comprises a vertical casing (1) with aliq. feed pipe (2) and an axial liq. evacuator (3) cylindrical filtration sections (5) with a cover (6) and porous intermediate (8) and bottom (10) partitions forming clean liq. (9) and filter charge (13) chambers (12). To increase capacity, part (13) consists of floating hollow aluminosilicate microspheres based on fly ash.

Holes (4), flange (7), tongue (11) and the Mohs (8) hardness of the microspheres in each section reduce the overall wear of the installation. for regeneration, the clean liq. is introduced via part (3), and the sludge leaves via pipe (2).

USE/ADVANTAGE - Used in cleaning liquids from mechanical impurities, can be applied in cinema film developing. The design gives successive filtration based on hard microspheres. Bul.19/23.5.91
